RESULT 1 AAL43635 BP

(first entry) 05-SEP-2002

Porphyromonas gingivalis dipeptidylpeptidase-7 (DPP-7) coding sequence.

Dipeptidylpeptidase-7; DPP-7; gene; ds; enzyme; amidolytic cleavage; DPP-7 inhibitor identification; periodontal disease; gingivitis; periodontitis.

Porphyromonas gingivalis.

                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                           The invention comprises the amino acid and coding sequence of the Porphyromonas gingivalis dipeptidyleptidase-7 (DPP-7) enzyme. The DPP-7 enzyme has amidolytic activity for cleavage of a peptide bond between the second and third amino acids from the N-terminal end of a target peptide. The DPP-7 target peptide has an aliphatic or aromatic residue as a substituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                  periodontal disease caused by Porphyromonas gingivalis (e.g. gingivitis or periodontitis). The present DNA sequence encodes the Porphyromonas gingivalis dipeptidylpeptidase-7 (DPP-7) enzyme of the invention.

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus progenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes.

Nucleic acids encoding (I) are used to detect Streptococcus in a compound binds to cilogical sample. (I) is used to detect Streptococcus in a compound binds to cilogical sample. (I) is used to detect streptococcus in a compound binds to composition comprising (I) or a nucleic acid encoding (I), may be used to recombinantly produce (I) and may be caid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity of promatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1924 -----CTCTTTGATGATAAGGTGATGAAACAGCTTAAACGTCGCCGTTATACTGGTTGG 1977

                                                                                                                                                                                                                                                                                                                                                                                                                       AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAX34388 to AAX94883 AAX91802 to AAX91989 represent PCR primers used in the 1solation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ArgHisThrGlyAspPheSerValPheArgValTyrAlaGlyAlaAspAsnArg-ProAl 240

Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAY34583. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antiblotics, the essential cannot be themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella preumoniae, Pseudomonas aeruginosa and Enterococcus facefalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WipO at the printed probablished_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       203

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        264 AlaAspAspTyrAlaMetThrIleGlyPheProGlySerThrAspArgTyrLeu---Thr 282
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes the isolation of a novel Streptococcus pneumoniae vals protein. The new polypeptide and antagonist are useful for the treatment of an individual with abnormal vals protein levels, by administering vals to individuals requiring vals polypeptide, and administering the antagonist to individuals requiring inhibition of vals polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New vals polypeptide and polynucleotide - useful for treatment of conditions associated with abnormal vals protein levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -----CACGCT

```
This DNA encodes a S. pneumoniae valS polypeptide (EC 6.1.1.9), a member of the valy1 tRNA synthetase family. The polypeptide can be expressed recombinantly by transforming host cells with vectors comprising the valS gene. ValS polypeptides and polynotelectides are useful for diagnosing diseases due to an infection of an organism and also the stage and type of the infection. The polypeptides are also used for screening for their modulators which can be used in the treatment of diseases. Diseases diagnosed, prevented or treated include otitis media, conjunctivitis, pneumonia, bacteremia, sinusitis, pleural empyema, endocarditis and especially meningitis. ValS polypeptides, polynucleotides and their (ant)agonists can prevent adhesion of bacteria to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial

```
This sequence represents DNA encoding Streptococcus pneumoniae valy1 tRNA synthetase (vals, NCIMB Deposit No. 40794). Streptococci are the cause of swrand diseases, including otitis media, conjunctivitis, pneumonia, bacteraemia, sinusitis, pleural empyema, endocarditis and especially meningitis. The frequency of S. pneumoniae infections has risen dramatically over the past 20 years, probably due to the emergence of multiply antibiotic resistant strains and an increasing population of immunocompromised people. ValS represents a target for new antibacterial capents. Inhibition of tRNA synthetases such as vals leads to a reduction in the levels of charged tRNA, which triggers a cascade of responses (known as the stringent response) resulting in a state or dormancy in the bacteriam vals, its variants and fragments, anti-vals antibadies, vals inhibitors and nucleotides encoding vals mationed as meningitis.

Companded to the compounds for inhibitory activity. Vals may also be useful as an antigen for vaccination of a host to produce specific antibodies which protect against bacterial invasion into damaged tissues. Such antibodies could, for example, prevent the adherence of bacteria to wounds. Nucleotides encoding vals may be used as capents, particularly for genetic immunisation.
Claim 13; Columns 7-10; 21pp; English.

                                                                                                                                                                                                                                                                                                        The invention describes an isolated valS polynucleotide encoding a mature polypeptide the same as that expressed by a valS gene contained in a deposited strain of Streptococcus pneumoniae, a complementary sequence or a polynucleotide containing at least 15 continuous bases of the polynucleotide. The antibody to the encoded protein is used for the treatment of microbial infection. This sequence encodes valS derived from
                                                                                                                                                                                                                                                         for producing a valS polypeptide, used disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (AAV52134 to AAV5524) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID NO: 1 to 391. The nucleotide sequence at least 95% dentical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391. AAV5524) are genomic fragments from Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule as a probe a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating members of the molecule and properly and produced from an organism, amplifying nucleic acid molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        primers derived from the fragment of the S. pneumoniae genome to prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the S. pneumoniae genome of commercial importance, expression modulating fragments of the S. pneumoniae genome of commercial importance from the present invention can be used in diagnosis kits and assays, an

```
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aurens, Salmonella typhi, Klebsiella preumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The convention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

```
notion relates to a protein (ABP25413-ABP30895) from group B coccus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS occus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS occus pyogenes), comprising one of 5483 sequences (S1), given in sification. The proteins have antibacterial and antiinflammatory (1), nucleic acids encoding (I), ABN66044-ABN71526 and lements for timent or prevention of infection or disease caused by cocus bacteria, particularly S. agalactiae and S. pyrogenes. acids encoding (I) are used to detect Streptococcus in a smaple. (I) is used to determine whether a compound binds to composition comprising (I) or a nucleic acid encoding (I), may be a vaccine or diagnostic composition. The disease caused by occus that is prevented or treated may be meningitis. Nucleic ording (I) may be used to recombinantly produce (I) and may be gene therapy. Antibodies to (I) are used for affinity gene therapy, immunoassays, and distinguishing/identifying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    s; GAS; GBS; group B streptococcus; Streptococcus agalactiae; ptococcus; Streptococcus pyogenes; antibacterial; gene; tory; infection; vaccine; meningitis; gene therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      occus protein for the treatment or prevention of infection saused by Streptococcus bacteria, such as meningitis, and ig a compound that binds to the protein -

Nucleic acid encoding transferrin binding protein 2 of Moraxella catarrhalis, useful for diagnostics, immunization and recombinant protein production -  Claim 2; Fig 6; 114pp; English.  This sequence encodes the Moraxella catarrhalis strain LESI transferrin binding protein (Tbp2) of the invention. This sequence is also referred to as the TbpB gene. The TbpB gene is used to produce recombinant Tbp2; for identification or diagnosis of Moraxella, or for cloning related for identification asserved.

```
Moraxella infections, e.g. otitis media. The Tbp2 proteins are useful as antigens, either in vaccines (including components of conjugate vaccines that contain antigens from other bacteria or from tumours, in which case they elicit production of antitumour antibodies that may be coupled to chemotherapeutic agents or biologically active agents) or to raise antibodies (for use as diagnostic reagents and for treating Moraxella infections), also for detecting Moraxella antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1045 GATGTTAATTTTGCTGATAAAAAATTAAAGGCAAACTTATCAGTAATCAGTTATCAGGC 1104

The present invention relates to nucleic acid sequences (ABQ67188-ABQ71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              also for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1735 ACTGCAGGACTCAAAGGCATGGGTAAATTCGGTAAGTTG-------GCTAGCGGT 1782

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                (ABO67188-ABO71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in anti-Listeria vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1857
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1858 GCAGGTGAAAAAACTGGTGGCTTTGGTGGTTCTTTAGGTGGT-----ATGGCTGGTGGT 1911

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. US20020172690A1
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: AN INFECTIOUS CDNA CLONE OF NORTH AMERICAN FORCINE
TITLE OF INVENTION: REPRODUCTIVE AND RESPIRATORY SYNDROME (PRRS) VIRUS AND
TITLE OF INVENTION: USES THERROF
FILE REFERENCE: PC10.278A
CURRENT APPLICATION NUMBER: US/10/127,391
CURRENT FILING DATE: 2002-04-22
PRIOR APPLICATION NUMBER: US/99/470,661A
PRIOR FILING DATE: 1999-112-22
NUMBER OF SEQ ID NOS: 45
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1617
